Home

I build and ship **AI-powered tools** for careers and finance.

I design and build consumer products end-to-end — from uncovering real problems to shipping production-grade experiences. Below are two live applications I own.

Actively looking for full-time AI PM roles. Let's talk.

About

I'm obsessed with AI-powered consumer products that solve real problems — especially in careers and fintech. I'd rather de-risk ideas by shipping than by deck. That means going from problem to prototype to production myself, so I can speak from experience when I lead product: I've felt the tradeoffs, the latency, and the joy of watching something work in users' hands.

ApplyStudio and Card Scout are the proof. I identified both problems from my own experience, validated them with others, then built and launched the full stack — product, UX, and backend. I learned how fast you can iterate when you own the whole loop: discovery, hypothesis, build, ship, learn. That PM arc — problem, insight, decision, outcome — is what I care about, whether I'm building solo or with a team.

I'm looking for my next AI PM role at a company that ships. I want to own a product or area where AI is central to the value proposition, and where I can combine product sense with hands-on building. I'm also open to product collaboration and advisory work for teams betting on AI-powered consumer or fintech products.

◆ Skills

Product

- Problem discovery & validation
- Product strategy & roadmapping
- User research & feedback loops
- Metrics & success criteria
- Go-to-market planning

Technical

- TypeScript & Next.js
- AI/LLM integration (OpenAI, Anthropic)
- Web scraping & data pipelines
- Database design (Postgres, JSON)
- Deployment & DevOps (Vercel, AWS)

Domain

- Fintech & rewards optimization
- Job search & career tools
- AI-powered workflows
- Consumer product strategy
- B2C growth & retention

■ Experience

AWS

Senior Partner Manager

May 2025 – Present

Led product strategy for AWS Marketplace partnerships, driving 157% revenue growth (\$84M → \$216M) and improving customer retention by 20% through a new License Switching feature.

Meta

Product Manager, Infrastructure & Data Centers

Jun 2024 – Apr 2025

Owned the Digital Twin platform for AI data centers — redesigned the UI (60% adoption increase), cut costs by \$250M per region, and shipped two 0→1 tools including an ML-enabled alerting system.

Zoox

Senior Technical Product Manager

Feb 2022 – Jun 2024

Built 0→1 robotaxi tools including remote diagnostics, autonomous braking, and a 3D rider visualization app, while cutting ML infrastructure costs by 25% across 200+ engineers.

Apple

Product Design Lead

May 2015 – Feb 2022

Led NPI programs for four iPhone generations and Vision Pro's 4K display testing line. Built Apple's first OLED chip-level testing platform, improving yield by 50% and securing \$2M in investment.

Work

Selected products I designed and built end-to-end. Each represents a complete journey from problem identification to production deployment.

ApplyStudio

Live Product · Product Manager & Solo Builder · 2024 – Present

AI-powered job application platform: resume tailoring, cover letters, ATS scoring — across 20+ jobs at once.

Live app: <https://applystudio.app> · GitHub: <https://github.com/boozinix>

■ The Problem

Job seekers spend hours per application customizing resumes, writing cover letters, and answering application questions — all manually, for each role — while still missing ATS keywords that filter them out.

Why now: GPT-5.1 and multi-agent orchestration make it possible to parallelize complex rewriting tasks across dozens of job postings at once, compressing what used to take days into minutes.

■ Insight & Approach

ApplyStudio built an in-house job scraper outperforming commercial solutions, then layered a multi-agent AI workflow for resume tailoring (bullet-by-bullet accept/edit/reject UI), cover letter generation, application Q&A, and comprehensive ATS scoring — all running in parallel across 20+ jobs.

- Built in-house web scraper extracting job descriptions, requirements, and application questions.
- Designed multi-agent AI workflow using GPT-5.1 for resume tailoring with bullet-by-bullet accept/edit/reject UI.
- Implemented cover letter generation and application question answering at scale.

■ What We Built

ApplyStudio separates job ingestion, AI orchestration, and user review into distinct layers — enabling parallel processing across dozens of jobs while keeping the human in control of every output.

- Scraping Layer: in-house crawler outperforms commercial solutions on difficult job sites, extracting descriptions, requirements, and application questions.
- Multi-agent AI Orchestration: GPT-5.1 agents run in parallel — one per job — for resume tailoring, cover letters, and application Q&A;
- Bullet-by-Bullet UI: accept/edit/reject interface gives users granular control over every AI-rewritten resume bullet.
- ATS Scoring Engine: real-time keyword matching, skill gap analysis, and ranking across 20+ jobs simultaneously.
- Local Persistence: draft state and preferences are persisted locally to support non-linear application workflows.

■ Results

- Scraped job descriptions more accurately than ScrapingBee (20% improvement on difficult sites).
- Enabled candidates to process 20+ simultaneous job postings with full AI-tailored applications.
- Reduced per-application work from hours to minutes while maintaining candidate voice and control.
- Real-time ATS fit scoring surfaces high-fit opportunities and skill gaps proactively.

■ Tech Stack

Next.js · TypeScript · Vercel · GPT-5.1 · Multi-agent AI

Card Scout

Live Product · Product Manager & Solo Builder · 2024 – Present

AI-assisted credit card discovery with multi-model recommendations and automated data ingestion.

Live app: <https://thecardscout.app> · GitHub: <https://github.com/boozinix/the-card-scout>

■ The Problem

Consumers face analysis paralysis choosing among 100+ credit cards, leaving thousands of dollars in rewards unused — while most comparison sites are affiliate-driven and ignore individual spending patterns.

Why now: Multi-model LLM orchestration now makes it possible to combine structured valuation logic with AI reasoning to personalize recommendations at a level no static comparison site can match.

■ Insight & Approach

Card Scout combines multi-model AI orchestration (GPT-5, Claude, DeepSeek) with automated data ingestion using bank-specific crawlers, a guided quiz UX, and a valuation engine that ranks cards by real expected annual value for your specific spending profile.

- Built automated data ingestion pipelines using bank-specific crawlers with validation scripts.
- Implemented multi-model orchestration (GPT-5, Claude, DeepSeek) for recommendation quality.
- Designed guided workflow UX with autocomplete, local persistence, and mobile-first principles.

■ What We Built

Card Scout separates data ingestion, valuation logic, multi-model AI orchestration, and the user-facing quiz into distinct layers — making it easy to extend to new issuers or geographies.

- Data Pipeline: bank-specific Playwright crawlers with validation scripts pull card terms into a structured Postgres schema.
- Multi-model Orchestration: GPT-5, Claude, and DeepSeek used in combination for recommendation reasoning and explanation.
- Valuation Engine: pure TypeScript functions compute expected annual value from spend profile, multipliers, and perk valuations.
- Guided Quiz UX: autocomplete-enabled flow collects priorities and constraints with local persistence for non-linear sessions.
- SEO Architecture: dedicated pages for issuer rules, transfer partners, and calculators optimized for organic discovery.

■ Results

- Cuts card research time from hours to under 2 minutes.
- Surfaces card combinations worth hundreds to thousands of dollars annually in net rewards.

- Multi-model orchestration improves recommendation quality by leveraging model-specific strengths.
- SEO-optimized architecture for issuer rules, transfer partners, and calculator pages drives organic discovery.
